# Amazing Eyes!

Eyes are amazing. They let us see. Many living things have eyes. Humans, cats, birds, insects and fish all have eyes.

Not all eyes look or act the same, though. Each type of eye is special. It helps its owner live and grow in its environment.

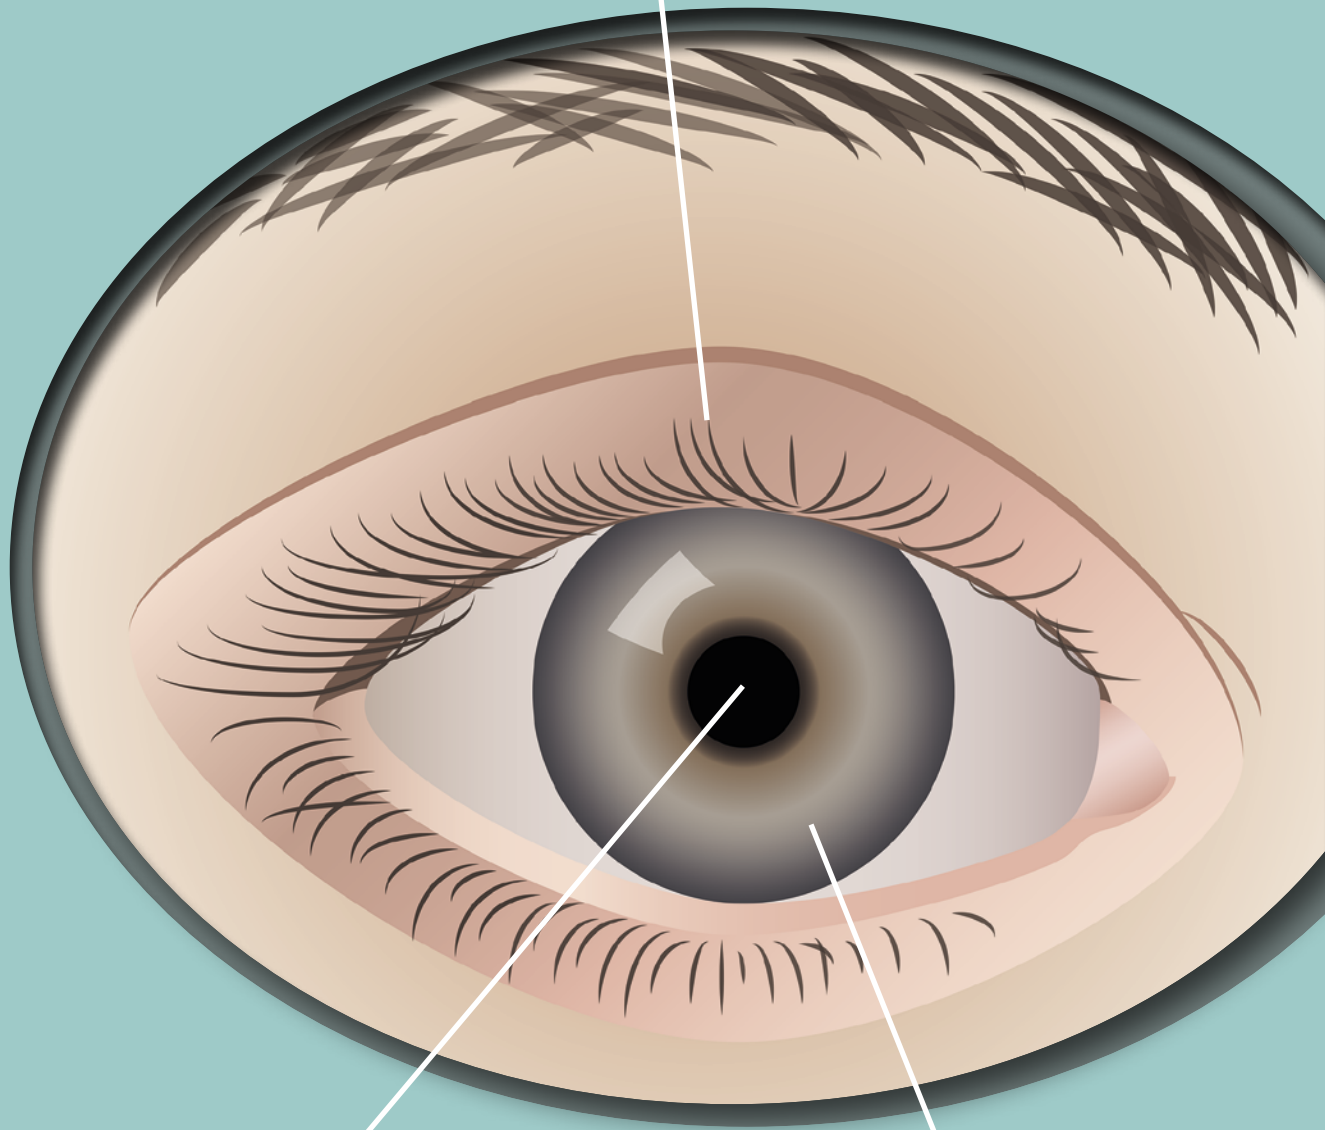

# How Do Eyes Work?

Eyes let us see the world around us. Light goes through a hole in each eye. This hole is called the **pupil**. Then nerves in the eyes send **signals** to the brain. The brain uses these signals to form pictures of the world.

The eyelid and eyelashes protect the eye.

The pupil lets light into the eye.

The iris is the coloured part of the eye.
